

LAB EXERCISE 10

1. Implement a calculator using the provided *index-calculator.html* file.
 - a. Use the text input field to show entered values and calculation results.
 - b. Use event delegation on the parent element to handle all button clicks:
 - Pressing "=" should evaluate the entered expression and display the result.
 - Pressing "Reset" should clear all content from the input field.
 - Pressing "Delete" should remove the last entered character from the input field.
2. Add the necessary markup to create the form. Customize the design using Bootstrap.
 - a. Write a function that adds tasks to a list when the "Add Task" button is clicked
 - b. Write a function to remove a specific task from the list when the 'remove' button is clicked
 - c. Empty tasks should not be added to the list
